Fiche technique

PERSISTANCE / Dys focus Nature Collection

Black box : project in a space without any light for maximum effect.

Video projector (projects non-bright blacks)

Phosphorescent screen (provide shipping and assembly costs)

The phosphorescent screen is to be mounted on a frame (insurance 900€)

Do not allow touching the screen (traces)

Welded PhosphorFoil -

Phosphor (article number: 4960 0150 0700)

Width: 150 cm - Weight: 450 g/m²

Ign.: FMV 55302/B

200cm H x 300cm wide

All around: welded reinforcement with welded eyelets and SpanFix every 20 cm

The video projector is placed in such a way that the spectators mask the projection beam when they are in front of the screen. From their body, they must be able to hide part of the projected image in order to see the luminous afterglow of the images of plants on the phosphorescent material

The video file is provided in full hd or 4K

Different views can be offered depending on the place or theme (views range from wide views of glades to close-ups of plants).

Another possibility is to project the image on a black screen for a very nice effect without a phosphorescent screen.
